- .NET FULL STACK SENIOR DEVELOPER
- Replaced legacy reporting system with a custom HTML-to-PDF solution, reducing dependency on unsupported technologies
  - Designed and implemented a custom HTML-to-PDF generation system (20+ document types), replacing legacy unsupported reporting tools
  - Reduced document update time from 1–2 days to same-day changes, significantly improving development speed and maintainability
  - Eliminated dependency on outdated libraries with missing documentation, stabilizing the document generation pipeline

- .NET / JAVA DEVELOPER
- Contributed to feature development across both .NET and Java stacks in a cross-team environment
  - Improved maintainability of reporting components used by enterprise clients

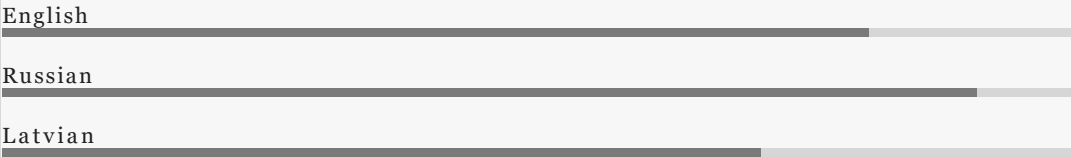

- .NET FULL STACK SENIOR DEVELOPER
- Reduced data migration time from several days (planned ~1 week) to under 1 hour by introducing multithreading and optimizing data processing pipelines
  - Increased data processing performance by ~30% through SQL query optimization and improved data handling
  - Designed and implemented system integrations, improving data flow reliability
  - Reduced production issues by fixing critical bugs in core modules

- .NET FULL STACK SENIOR DEVELOPER
- Built and optimized database-driven features, improving system performance and scalability
  - Developed APIs and reporting solutions used in production environments
  - Improved data handling using MongoDB and relational databases

- .NET FULL STACK DEVELOPER
- Supported and developed internal tools.

- .NET FULL STACK DEVELOPER
- Optimized MSSQL queries in a high-load, data-intensive system (GB–TB scale), improving performance of core operations
  - Optimized SQL queries that previously caused 10–20 minute table locks, significantly improving system stability and concurrency
  - Worked on performance-critical systems where database efficiency directly impacted business metrics
